AP - Mode

How can I connect to a Shelly in AccessPoint mode?

After applying the supply voltage, a new Shelly automatically starts in **A**ccess**P**oint mode.

To connect, proceed as follows:

1. make new Shelly (if necessary) tensionless
2. after a short wait Shelly turn on again
3. Click on the WLAN symbol at the bottom of the taskbar on the computer
4. there click on the then visible network "Shelly-12346" (numbers are different) and connect
5. start browser
6. call address 192.168.33.1

I wish you success.
